

**ABSTRACT**

Please enter the following Abstract:

An apparatus for securing an appliance to a support surface comprises a first base and a second base. The first and second bases are sized to allow the first base to be nestable within the second base. The first base is movable between first and second positions with respect to said second base. In the first position, the bases are in an unlocked position and an interlocking means is disengaged; and in the second position, the interlocking means is engaged to interlock the bases.
